

# Wireless Locks for Senior Living

Senior living communities strive to create environments that balance resident dignity, independence, and safety. Traditional lock-and-key doors work against these goals: they are easily lost, difficult for residents with dexterity challenges, and offer no visibility into door activity. Lost keys and resident turnover also create administrative burdens and costly re-keying projects. Verkada wireless locks modernize access control by replacing physical keys with accessibility-friendly credentials. Managed through Command, staff can centrally oversee every door and manage access for every party – from remotely unlocking doors for residents and caregivers to granting temporary access for visiting families

## Lock-and-key doors

- ✗ Keys can be hard to use for seniors
- ✗ No central governance, making resident turnover or guest access harder

## Wired access control

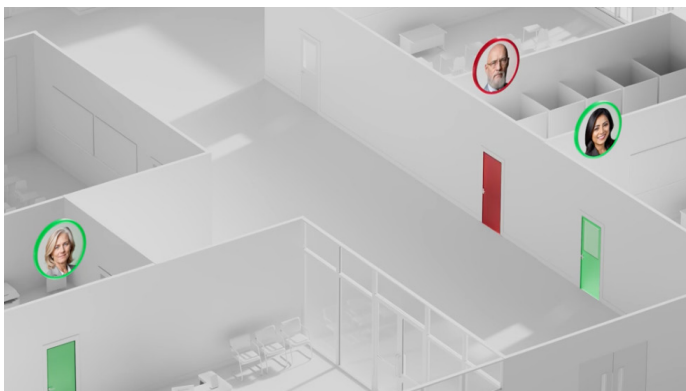

- ✗ Costly and complex wiring
- ✗ Tough to scale across large door footprint

## Wireless locks

- ✓ Accessible, easy-to-manage credentials
- ✓ Central control over door access permissions
- ✓ Affordable installation with no wiring to doors

## Improved resident access and safety

Replace hard-to-use keys with accessibility-friendly options, like keycards and hands-free mobile unlock. Empower staff to remotely unlock doors via web or mobile for residents or for caregivers who need to access rooms in case of medical emergencies.

## Simplified credential management

Replace costly re-keying projects with automated user and credential management. Leverage robust APIs or SCIM/SSO integrations to dynamically onboard and offboard users and revoke credentials based on resident turnover.

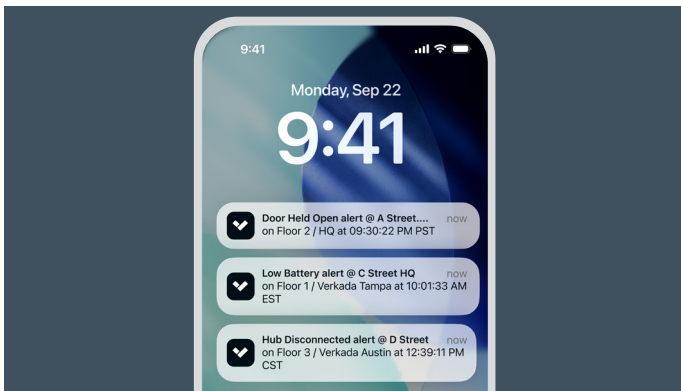

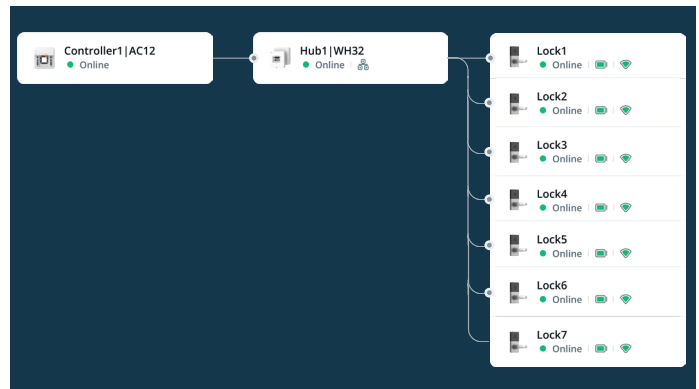

## Easily provide visiting families temporary access

Grant visiting families time-bound access to resident doors. Customize time windows, specify door access, and enable access via physical keycards or digital credentials.

## Scalability and site-wide standardization

Easily scale wireless locks and standardize resident experience across facilities. Avoid hopping between systems and manage every step – from pairing locks to wireless hubs to setting door schedules – in Command. Monitor doors across sites centrally, maintain comprehensive access event logs, and empower staff to take action on the go from their phone.

## Robust performance

Keep locks up-to-date with automatic firmware updates. Replace onerous door-by-door checks with proactive low battery alerts to prompt changes when needed. Maintain operations during a range of scenarios, like dead batteries, network outages, and lock disconnections from wireless hubs.

## Extended communication range

Support locks up to 150 feet away in standard environments and up to 2,000 feet away with clear line of sight using Vekada’s state-of-the-art VLink wireless protocol.
